LAB-1

Git and Github

Theory

Git

Git is distributed version control system used for source code management. It is a free and open-source version control system used to handle small to very large projects efficiently. Git is used to track changes in the source code, enabling multiple developers to work together on non-linear development. Linus Torvalds created Git in 2005 for the development of the Linux kernel.

Working with Git

- Initialize Git on a folder, making it a **Repository**
- Git now creates a hidden folder to keep track of changes in that folder
- When a file is changed, added or deleted, it is considered **modified**
- You select the modified files you want to **Stage**
- The **Staged** files are **Committed**, which prompts Git to store a **permanent** snapshot of the files
- Git allows you to see the full history of every commit.
- You can revert back to any previous commit.
- Git does not store a separate copy of every file in every commit, but keeps track of changes made in each commit!

GitHub

GitHub is a web-based platform that provides version control and collaboration tools for developers, enabling them to manage, store, and track changes in their code efficiently. Built on Git, an open-source version control system created by Linus Torvalds, GitHub allows developers to work on projects individually or as a team. It offers features such as repositories for storing code, branches for parallel development, pull requests for code reviews, and issue tracking for project management.

Forking & Cloning

- **Forking** creates a personal copy of another user's repository.
- **Cloning** downloads a repository to a local computer for offline development.

Common Git and Github Commands

Git Configuration

git config --global user.name "Your Name"

This command sets the global username for the Git commits.

git config --global user.email "your_email@example.com"

This command sets the global email associated with Git commits.

Git Initializing

git init

This command initializes a new git repository in the current directory.

Git Linking

git remote add origin <repo>

This command links the new repository of github with the local codes.

Git Staging and Commits

git add .

This command adds files to the staging area.

git commit -m "message"

This command commits and saves changes of stage area with a message.

Git Status and Log

git status

This command checks the status of the working directory.

git log

This command view commit history.

Git Branching and Merging

git branch

This command lists all the branches that exist in the repository.

git branch <branch_name>

This command creates a new branch for separate development.

git checkout <branch>

This command switches to another branch.

git switch <branch_name>

This command switches to another branch.

git merge <branch_name>

This command merges a specified branch into the current branch.

Git Push and Pull

git push -u origin <branch_name>

This command uploads commits to a remote repository

git pull origin

This command fetch and merge changes from a remote repository

Git Clone

git clone <repo_url>

This command copy(clone) an existing repository.

Lab Work

Initially, a folder is created to create, change the files using the version control git with different commands and git is initialized.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git init
Initialized empty Git repository in D:/vbnet/.git/
```

We set the global username and email of GitHub. As no any files are created there is nothing to commit.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git config --global user.name "rshkprz"

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git config --global user.email "rshkprjpt@gmail.com"

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git status
On branch master

No commits yet

nothing to commit (create/copy files and use "git add" to track)
```

Then we create two empty files in master branch and with the help of echo we insert text on those files and checked the status , it is in untracked stage and we sent the files to the staging stage.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ echo "hello world">greet.txt

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ echo "test.">test.txt

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git status
On branch master

No commits yet

Untracked files:
  (use "git add <file>..." to include in what will be committed)
    greet.txt
    test.txt

nothing added to commit but untracked files present (use "git add" to track)
```

The files are then added for staging and commit the files with the message such that the files are stored in the local repository. Then we checked git status, there was nothing left to commit.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git add .
warning: in the working copy of 'greet.txt', LF will be replaced by CRLF the next time Git touches it
warning: in the working copy of 'test.txt', LF will be replaced by CRLF the next time Git touches it

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git commit -m "initial commit"
[master (root-commit) ae760d8] initial commit
 2 files changed, 2 insertions(+)
 create mode 100644 greet.txt
 create mode 100644 test.txt

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git status
On branch master
nothing to commit, working tree clean

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git log
commit ae760d8b4bfbeaa27e831dfb96e26732d19841b (HEAD -> master)
Author: rshkprz <rshkprjpt@gmail.com>
Date: Sat Mar 22 13:08:11 2025 +0545

    initial commit
```

We again made certain changes in file text.txt to see certain changes in the file status. And again commit it so that all of the files are saved in the local repository.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git status
On branch master
Changes not staged for commit:
  (use "git add <file>..." to update what will be committed)
  (use "git restore <file>..." to discard changes in working directory)
        modified:   greet.txt

no changes added to commit (use "git add" and/or "git commit -a")
```

We then add the files in the remote repository by creating the repository in the GitHub and copying the url of the repo and using the above code.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git remote add origin https://github.com/rshkprz/vbnet.git
```

After that we push the files to the created repository.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git push -u origin master
Enumerating objects: 4, done.
Counting objects: 100% (4/4), done.
Delta compression using up to 8 threads
Compressing objects: 100% (2/2), done.
Writing objects: 100% (4/4), 267 bytes | 267.00 KiB/s, done.
Total 4 (delta 0), reused 0 (delta 0), pack-reused 0
To https://github.com/rshkprz/vbnet.git
 * [new branch]      master -> master
branch 'master' set up to track 'origin/master'.
```

We checked the existing branch in our local repository. Then we create branches for working different versions of programs without affecting the main code.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git branch
* master

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git branch dev

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git branch
dev
* master
```

We switched to new branch “dev” branch where we modify and add different files without affecting the main code. We here added new files “add.c”. Initially it is in untracked stage.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (master)
$ git checkout dev
Switched to branch 'dev'

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (dev)
$ git status
On branch dev
Untracked files:
  (use "git add <file>..." to include in what will be committed)
    add.c

nothing added to commit but untracked files present (use "git add" to track)
```

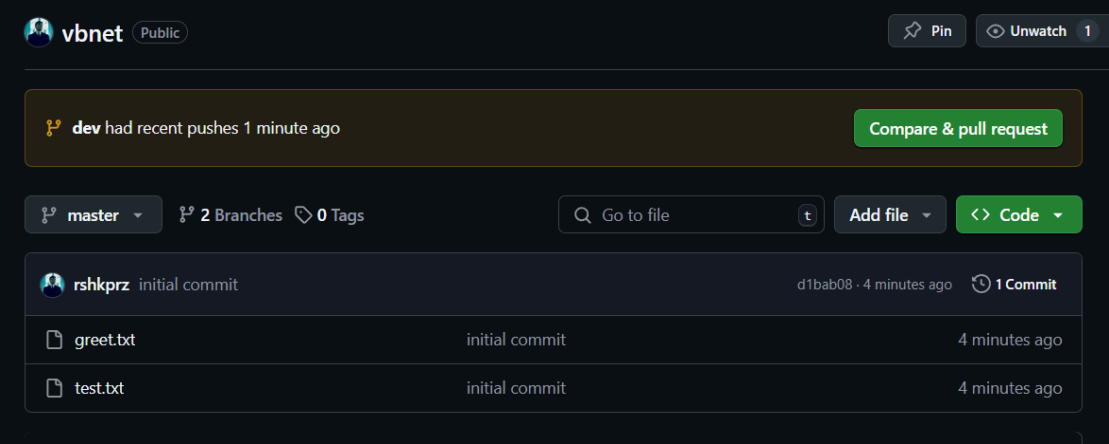

Then we commit the changes and push the branch in the GitHub to make sure the branch is visible to other users of the repository.

```
rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (dev)
$ git add .

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (dev)
$ git commit -m "change to new branch"
[dev 2143f2a] change to new branch
1 file changed, 10 insertions(+)
create mode 100644 add.c

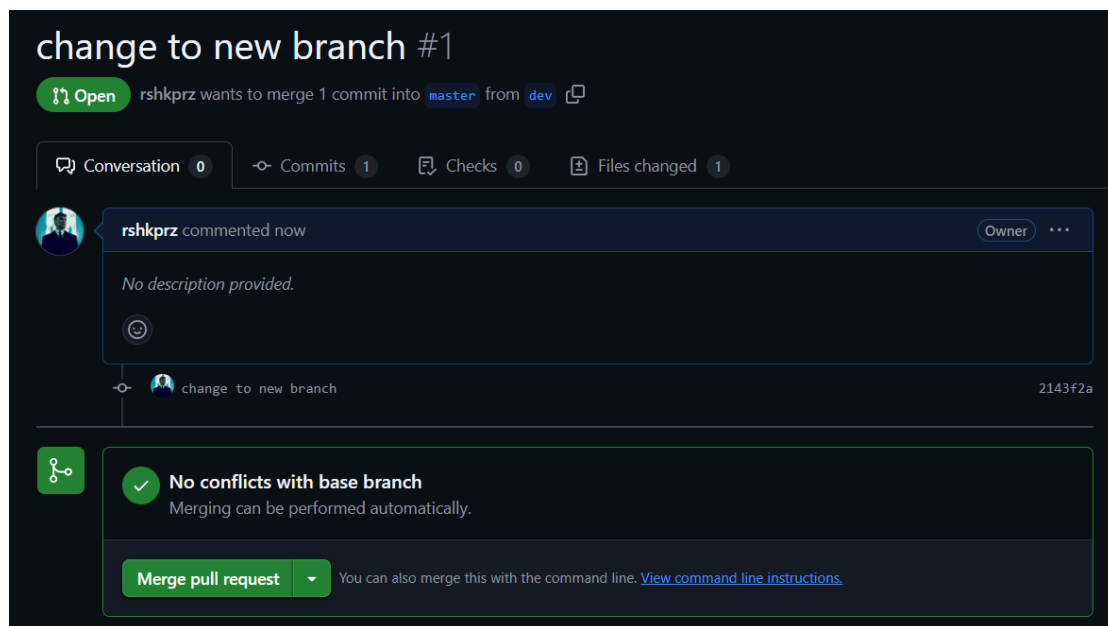

rshkprz@DESKTOP-NC7Q30F MINGW64 /d/vbnet (dev)
$ git push -u origin dev
Enumerating objects: 4, done.
Counting objects: 100% (4/4), done.
Delta compression using up to 8 threads
Compressing objects: 100% (3/3), done.
Writing objects: 100% (3/3), 443 bytes | 443.00 KiB/s, done.
Total 3 (delta 0), reused 0 (delta 0), pack-reused 0
remote:
remote: Create a pull request for 'dev' on GitHub by visiting:
remote:   https://github.com/rshkprz/vbnet/pull/new/dev
remote:
To https://github.com/rshkprz/vbnet.git
 * [new branch]      dev -> dev
branch 'dev' set up to track 'origin/dev'.
```

Then we create pull request for merging the latest branch pushed.

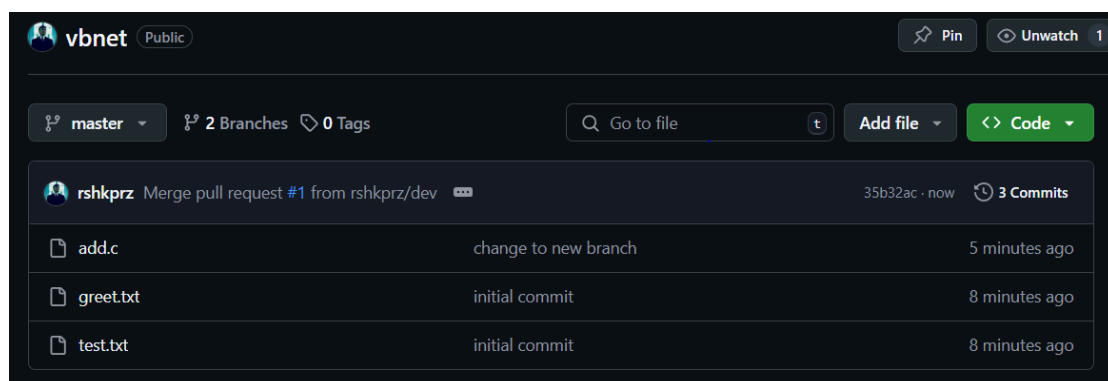

The screenshot shows the GitHub interface for a repository named 'vbnet' (Public). At the top, there's a notification bar stating 'dev had recent pushes 1 minute ago' with a green button 'Compare & pull request'. Below this, the repository navigation bar shows 'master' as the selected branch, with '2 Branches' and '0 Tags'. A search bar 'Go to file' and buttons 'Add file' and '<> Code' are also visible. The commit history section shows a single commit by 'rshkprz' titled 'initial commit' with hash 'd1bab08' from '4 minutes ago'. The commit details show two files: 'greet.txt' and 'test.txt', both marked as 'initial commit' and pushed '4 minutes ago'.

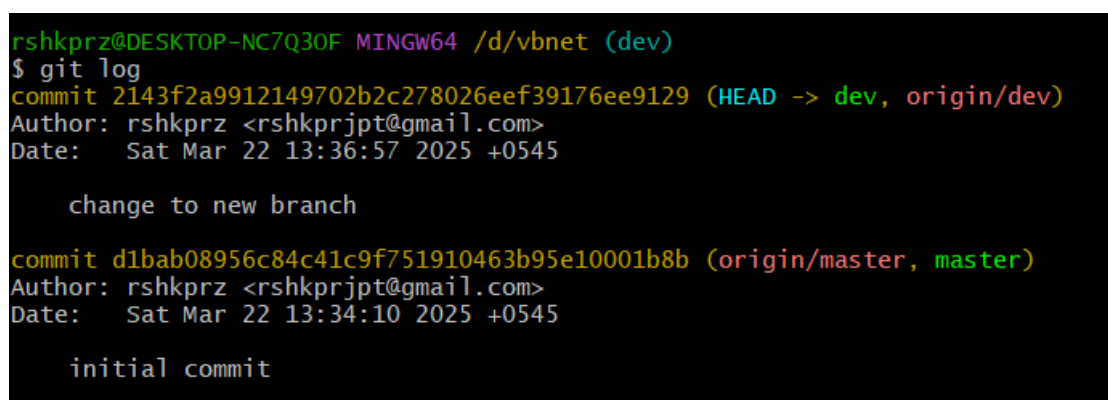

There was no any conflict so we merged the new branch into master branch.

After completion of merge we can see all the files in master branch.

With the help of command “git log” we viewed the history of the commits.

Conclusion

In this lab, we learned and performed different commands for initializing, linking, committing, branching and merging in Git and Github.
